ABSTRACT

A study was undertaken to obtain current information about individuals professionally concerned with linguistics and related fields. The study is based on information from the 1968 questionnaire of the National Register of Scientific and Technical Personnel. Four aspects of the core community are emphasized: (1) academic training: highest degree earned, year of highest degree, degree-granting institution, major subjects, and foreign languages studied; (2) professional characteristics: place of employment, professional identification, employment status, type of employer, work activities, ESL experience, and membership in professional societies; (3) biographic background: place of birth, age and sex; and (4) mobility of the community: geographic distribution of the respondents according to birth, education, and employment. The study is supplemented by numerous tables, graphs, and maps illustrating the data, and a copy of the questionnaire is provided. (Author/AM)

* Documents acquired by ERIC include many informal unpublished *
* materials not available from other sources. ERIC makes every effort *
* to obtain the best copy available. Nevertheless, items of marginal *
* reproducibility are often encountered and this affects the quality *
* of the microfiche and hardcopy reproductions ERIC makes available *

and by Place of Birth 53

1. Introduction

The following study was undertaken by the Language Information Network and Clearinghouse System (LINCS) project of the Center for Applied Linguistics (CAL) to obtain current information about individuals professionally concerned with linguistics and related fields. This is a selective study focused on a core population as defined by those individuals in the language sciences community responding to the 1968 circularization of the National Register of Scientific and Technical Personnel questionnaire and not on the entire community. While some inferences can be made concerning the American language sciences community in general, the statistics used are limited to the National Register respondents.

The goal of the LINCS project is the implementation of a clearinghouse system for the organization, storage, and dissemination of information in the language sciences. An essential stage in the development of this system is an investigation into the potential LINCS producers and users community, a network of professionals, institutions, and professional societies. This report is one of a series of LINCS project studies intended to provide a comprehensive perspective of that community through up-to-date analyses of new areas of study in linguistics, predominant academic institutions in the language sciences, neglected areas of language knowledge, professional society membership, work activities, areas of employment, manpower information, and sources of professional information. This study emphasizes four aspects of the core community:

1. The academic training of the respondents: highest degree earned, year of highest degree, degree-granting institution, major subjects, and foreign languages studied;
2. Professional characteristics of the respondents: place of employment, professional identification, employment status, type of employer, work activities, and experience teaching English as a foreign language, membership in professional societies;
3. The biographic background of the respondents: place of birth, age, and sex;
4. Mobility of the respondent community: geographic distribution of the respondents according to birth, education, and employment.

2. Procedure

Since 1954, the National Science Foundation has maintained a National Register of Scientific and Technical Personnel, the purpose of which is to obtain current information on the economic and professional characteristics of personnel in important scientific fields. This information is collected biennially by means of questionnaires circulated to individual scientists by the National Science Foundation and various cooperating societies. In 1964, for the first time, a National Register questionnaire directed specifically toward linguists was circulated by the Center for Applied Linguistics. This was followed by another circularization in 1966 and again in 1968. This study is based on the data collected from the questionnaires returned from the 1968 circularization. (See appendix A for a copy of the questionnaire.) The data were coded, processed by computer, and then analyzed.

The mailing list consisted mainly of the membership list of the Linguistic Society of America (LSA) and of those additional individuals known or believed to be involved in linguistics and closely related fields. Of the 4,526 questionnaires which were originally sent, 481 were returned by the Post Office as undeliverable. Thus, the number of questionnaires sent and presumed delivered is 4,045, of which 2,205 were returned to LINCOS. This represented a response rate of about 55%, as compared with 59% for the 1964 and 1966 circularizations.

Of those questionnaires returned, 2,088 provided the statistics used in this study, in which, due to the nature of the mailing list, the number of linguists exceeded that of the teachers of foreign languages.¹ Of the respondents, 1,541 were classified by the National Science Foundation as specifically scientific personnel. Since LINCOS is intended to serve a large, interdisciplinary public of varied interests and specialties in the language sciences, the remaining 547 respondents were included to expand the scope of this study to encompass other individuals in the language sciences as well, primarily language teachers in institutions of higher education.

The 117 deletions (5% of the 2,205 questionnaires returned) represented duplicate and incomplete questionnaires, unqualified responses, foreigners not resident in the United States, and questionnaires returned unanswered or received after processing was completed.

¹18% of the 6,000 scientific linguists and 1% of the 150,000 language teachers in the United States represented in this study.

3. Profile of the American Language Sciences Core Community, 1968

3.1. Average Profile

For purposes of this survey, the various data on the respondent community, presented in detailed analysis in the body of this report, were condensed into the following summary to provide a composite profile incorporating the general characteristics of the community. In brief, the average member of this community was young (under 40), male, and had recently earned a doctorate from a major university, majoring in the structure of a language or in linguistics. This composite respondent, who specialized in second language pedagogy, considered himself professionally to be a linguist or language teacher with a professional background of about 13 years. He was employed full time by an institution of advanced education and devoted most of his time to teaching and research.

About one-fourth of his colleagues had been born abroad and were currently employed in the United States; only 24% were female.²

The majority of his colleagues holding a Ph.D. or a B.A. as their highest degree identified themselves as language teachers. As to primary work activities, the majority of the Ph.D.'s and M.A.'s devoted most of their time to teaching, while research demanded most of the time of those colleagues with a B.A. as their highest degree. This was perhaps explained by the fact that a large number of the B.A.'s were part-time students working on advanced degrees. Over one-fourth of this community cited applied linguistics as their employment specialty. 1% of the entire group were retired.

The community was, generally speaking, a mobile one with a greater flow of personnel into the United States than out. The community covered had grown from 1,351 in the 1964 circularization of the National Register questionnaires to 2,088 in 1968, an increase of 54%. New York, California, and the District of Columbia still led in the number of personnel, respectively followed by Illinois in fourth place (Michigan was fourth in 1964) and by Pennsylvania which took Illinois' former place as fifth highest in concentration.

²9% of all the scientists in all disciplines in the 1968 National Register were women; in the linguistics sector of the Register, 22% were women.

The high concentrations in New York and California were explained by the fact that these states in general have the largest number of residents. The District of Columbia accounted for a considerable segment because of the large number of government agencies and departments, foreign language schools, universities, and the Center for Applied Linguistics. Illinois and Pennsylvania had the greatest number of respondents employed in advanced educational institutions.

3.2. Profile Elements

3.2.1. Highest Degree Earned. The highest degree held by 55% of the respondents was the doctorate, more than one-fourth held the master's as their highest degree, and less than one-tenth held the bachelor's. This was a striking contrast with the 1966 picture of American scientists as a whole; then the National Register reported 37% with a doctoral degree, 27% with a master's degree, and 30% with a bachelor's degree.

3.2.2. Institutions Granting Degrees and Attendance at Summer Linguistics Institutes. The University of Michigan led as the institution granting the greatest number of degrees, followed by Harvard University, Columbia University, Indiana University, the University of California at Berkeley, the University of Chicago, The University of Illinois, the University of Wisconsin, Yale University, the University of Texas, and the University of Pennsylvania. They granted 83% of the degrees granted by the 91 institutions reported. Two-fifths of the respondents reported that they had attended summer linguistic institutes.

3.2.3. Foreign Language Knowledge. The average number of languages per respondent was four; the number of respondents having no competence in a language other than English was minimal. The total list of languages indicated was predictably large, with French, German, and Spanish representing the greatest number of respondents, 77%, 60%, and 45%, respectively.

3.2.4. Place of Employment. Of those respondents born in the United States, 42% are employed in the East North Central and Middle Atlantic regions, 6% less than the percentage indicating these areas as "place of birth". (See Maps 1 and 2.) The percentage for place of employment in the Pacific region (California, Oregon, Washington, Alaska,

and Hawaii), however, was almost double that of "place of birth". The greatest number of respondents were employed in New York (231), followed by California (221), Illinois (115), and Pennsylvania (95). 116 respondents were employed in the District of Columbia (South Atlantic region).

3.2.5. Professional Identification. Because the question concerning professional identification did not list choices, responses were unstructured, but reflected two basic points of view. Of those respondents who answered in terms of work activity (802), 87% reported teacher, professor, educator, instructor, or lecturer as their professional identification. Of those who understood the question to mean field of specialization (1,316), 42% identified themselves as linguists or specialists in linguistics, 13% as specializing in a foreign language. The remainder of the group interpreting the question in terms of specialization reported more specific titles, such as specialist in teaching English as a foreign language (TEFL), missionary linguist, computational linguist, etc.

3.2.6. Years of Professional Experience. The average linguist had between 11 and 15 years of professional experience. One-fourth of all the respondents reported less than 5 years of professional experience.

3.2.7. Present Employment Status. Of the respondents, 83% were employed in a full-time capacity while 7% indicated part-time status. 7% were not employed, of which half (i.e. a total of 70) were seeking positions. 1% were retired, accounting for less than half of those respondents 70 years or older.

3.2.8. Professional Specialization. Respondents belonged to three main groups: scientific linguists, language teachers, and specialists in other fields with linguistic training. Scientific linguists were further divided into two subgroups: those specializing in general linguistics and those specializing in the application of linguistics. 52% of the respondents specialized in scientific linguistics, 33% in language teaching, and 6% in other fields.

3.2.9. Type of Employer. 71% of the entire population were employed by colleges and universities with only 3% in industry. The contrast with scientists as a whole as represented in the 1968 National Register was remarkable: 40% of all scientists were employed by educational institutions and 32% by industry. 10% were employed by the federal government as compared with 5% of the linguists.

3.2.10. Primary and Secondary Work Activities. Nearly three-fifths of the respondents considered teaching as their most time-consuming work activity with only one-fifth involved primarily in research, the reverse of the 1966 National Register in which scientists as a whole rated research most often as the primary work activity, followed by teaching. In the present study, respondents most frequently paired teaching and research/report writing, with teaching first.

3.2.11. Experience in Teaching English as a Foreign Language. Over half of the respondents had experience in English as a foreign language. Of these, 44% reported teaching as the type of experience, 23% reported teacher training, and 25% reported coursework.

3.2.12. Professional Society Membership. As might be anticipated, most respondents (1,291) belonged to the Linguistic Society of America or to the Modern Language Association of America (778). Other societies to which over 100 respondents belonged were the Linguistic Circle of New York (430), now renamed the International Linguistic Association, the Association of Teachers of English to Speakers of Other Languages (253), the American Association of Teachers of Spanish and Portuguese (175), the American Association of Teachers of Slavic and East European Languages (174), The American Oriental Society (141), the American Association of Teachers of French (131), the American Anthropological Association (130), the American Association of Teachers of German (126), and the National Council of Teachers of English (110). The average number of societies to which a respondent belonged was two.³

3.2.13. Place of Birth. The highest concentration of respondents by place of birth was in the East, North Central (Wisconsin, Michigan, Illinois, Indiana, and Ohio), and the Middle Atlantic (New York, New Jersey, and Pennsylvania) regions. These regions accounted for 45% of the entire group and 48% of the American-born respondents employed in the United States. (See maps 1, 2, and 3.)

3.2.14. Age. The median age of the respondents in the language sciences was 40. The median age of all scientists in the 1968 National Register was 38 with 39 the median age for linguists in

³For more information on overlap see Charles A. Zisa, Overlap in Professional Society Membership in the Language Sciences, LINC #1-70 (Washington, D.C.: Center for Applied Linguistics, 1970).

that Register. According to the 1968 National Register, 20% of all scientists and 15% of the linguists were in their 20s, while only 8% of all respondents in the 1968 Register were in this age group.

4. Academic Training of the Respondent Community.

In general, the academic training of the respondents, both men and women, was recent and advanced. 55% held a Ph.D. as their highest degree, 27% held a master's degree, and less than 10% indicated a bachelor's degree as the highest held. Only 30 respondents, or 1%, indicated no degree or failed to respond to the question. Of all the degrees earned, the largest number were granted by such institutions as the University of Michigan, Harvard University, Columbia University, Indiana University, the University of California at Berkeley, the University of Chicago, the University of Illinois, the University of Wisconsin, Yale University, the University of Texas, and the University of Pennsylvania. Most of the degrees were earned between 1961 and 1965. Only 14% earned their highest degree before 1945. Two-fifths of the respondents had attended summer linguistic institutes.

In compiling the figures on major areas of study, no distinction was made as to the level of the degree. The greatest number of respondents had specialized in the structure of a language and in linguistics and cited second-language pedagogy as their current employment specialty. Most respondents indicated knowledge of languages other than English, the average number of languages per person being four. 122 languages were mentioned. French led with 77%, German and Spanish followed with 60% and 46% respectively.

Table 1. Number of Respondents by Highest Earned Degree

<u>Degree</u>	<u>Number of Respondents</u>
Bachelor's	188 (9%)
Master's	572 (27%)
Doctoral	1,139 (55%)
Foreign	159 (8%)
None/No response	30 (1%)
<hr/>	
Total	2,038 (100%)

NOTE: Because it is often difficult to determine the American equivalent of a degree received at a foreign institution, such degrees were listed separately.

Table 2. Number of Respondents by Highest Earned Degree and by Sex

<u>Degree</u>	<u>Male</u>	<u>Female</u>
Bachelor's	129 (6%)	58 (3%)
Master's	381 (18%)	189 (9%)
Doctoral	932 (45%)	205 (10%)
Foreign	123 (6%)	36 (2%)
None/No response	29 (1%)	6 (-)
<hr/>		
Total	1,594 (76%)	494 (24%)

NOTE: It is interesting to note in this cross-tabulation that the number of male respondents with a Ph.D. as their highest degree was more than four times that of female respondents of similar status, whereas for those with a B.A. or M.S. as their highest degree, the number of males was only slightly more than twice that of females.

Graph 1. Number of Respondents by Year of Highest Degree Earned

NOTE: Because of their relatively small numbers, degrees earned prior to 1946 were not included in this graph.

^aThe projection of the number of degrees to be received in the 1966-70 period is an extension of the 385 earned in 1968.

Table 3. Number of Respondents by Year of Highest Earned Degree

<u>Year of Degree</u>	<u>Number of Respondents</u>	<u>Year of Degree</u>	<u>Number of Respondents</u>
1900 & before	1	1941-1945	68
1901-1905	5	1946-1950	151
1906-1910	1	1951-1955	245
1911-1915	3	1956-1960	356
1916-1920	9	1961-1965	592
1921-1925	17	1966-1968	385
1926-1930	32	No response	74
1931-1935	64		
1936-1940	85	Total	2088

NOTE: The largest number of respondents, 28%, were granted their highest degrees between 1961 and 1965. The number of degrees earned between 1941 and 1945 was more than doubled in the post-war five-year period.

Table 4. Number of Earned Degrees by Institution

Syntax	1	0	1

NOTE: The subjects of all degrees reported by respondents, not just the highest, are included. Topics have been grouped. All who listed the structure of a foreign language (structure of French, etc.) were placed together as were those listing the history of specific languages.

^aLanguage sciences only.

Table 6. Number of Respondents by Foreign Language

<u>Language</u>	<u>Number of Respondents</u>
French	1602
German	1245
Spanish	951
Russian	431
Italian	416
Latin	268
Portuguese	214
Scandinavian (Swedish, Norwegian, and Danish)	162
Japanese	117
Classical Greek	109
Polish	108
Modern Greek	100
Arabic	98
Chinese	89
Serbo-Croatian	83
Dutch-Flemish	80
Hebrew	75
Czech and Slovak	69
Hindi-Urdu	68
Turkish	58
Sanskrit	50
Persian	48
Thai-Lao	43
Hungarian	40
Ukrainian	39
Rumanian	37
Bulgarian and Macedonian	35
Vietnamese	30
Indonesian-Malay	29
Icelandic	29
Yiddish	27
Finnish	26

NOTE: This table includes only those languages (32 out of 122) in which 26 or more respondents reported competence. Predictably, French, German, and Spanish, in that order, were the languages in which the greatest number of respondents indicated competence. According to the 1968 Register, most scientists in other disciplines

Table 6 cont.

reported German as the foreign language in which they were most competent. The competence reported in Vietnamese (30), Finnish (26), Dutch-Flemish (80), and Thai-Lao (43) was greater than the number of language schools offering courses in these languages would indicate. Conversely, Hindi-Urdu (68), Turkish (58), and Persian (48) were more frequently offered in language schools than was Dutch-Flemish (80). The relative frequency of reported competence in Ukrainian (39) and Rumanian (37) was perhaps partially explained by the supposition that native speakers of these languages, professionally involved in other languages, would have listed their native languages as part of their language competence profile. Possibly philological interest accounted for the large number of respondents indicating competence in Serbo-Croatian (83), Icelandic (29), and possibly Rumanian (37). The number of respondents reporting competence in Japanese (117), represented a considerable increase over the low number reporting such competence before World War II.

Table 7. Number of Respondents by Foreign Language

NOTE: Table 7 provides a breakdown, by language family, of the foreign language knowledge of the respondents. The Indo-European family embraces the largest number of respondents, dominated by the Romance, Germanic, and Slavic groups, in that order. The Baltic, Hittite, and Celtic groups are the most under-represented of the Indo-European languages. Of the remaining groups in that family, the languages which should be noted for their low representation are Sinhalese (2) of the Indic group, Pashtu (5) and Kurdish (1) of the Iranian group and Armenian (6) of the other Indo-European group. Other languages significant for their under-representation are: Somali (4) of the Afro-Asiatic family, Cambodian (5) and Malayalam (4) of the East Asian family, Javanese (4), Visayan (4), Ilocano (2) and Malagasy (1) of the Austronesian family, and Cree (2), Chippewa/Ojibwa (2), Blackfoot (1), Navajo (5) and Nahuatl (3) of the American Indian family.

The numbers opposite each group name (e.g., INDO-EUROPEAN, AFRO-ASIATIC, etc.) represent respondents who have general knowledge of the group rather than competence in specific languages within the group.

It should be noted that the respondent was asked to use a proficiency code (see appendix A) in listing the languages in which he had substantial knowledge. This code consisted of different levels of proficiency, from native- or near-native-speaking command to extensive linguistic analysis to general conversation adequacy.

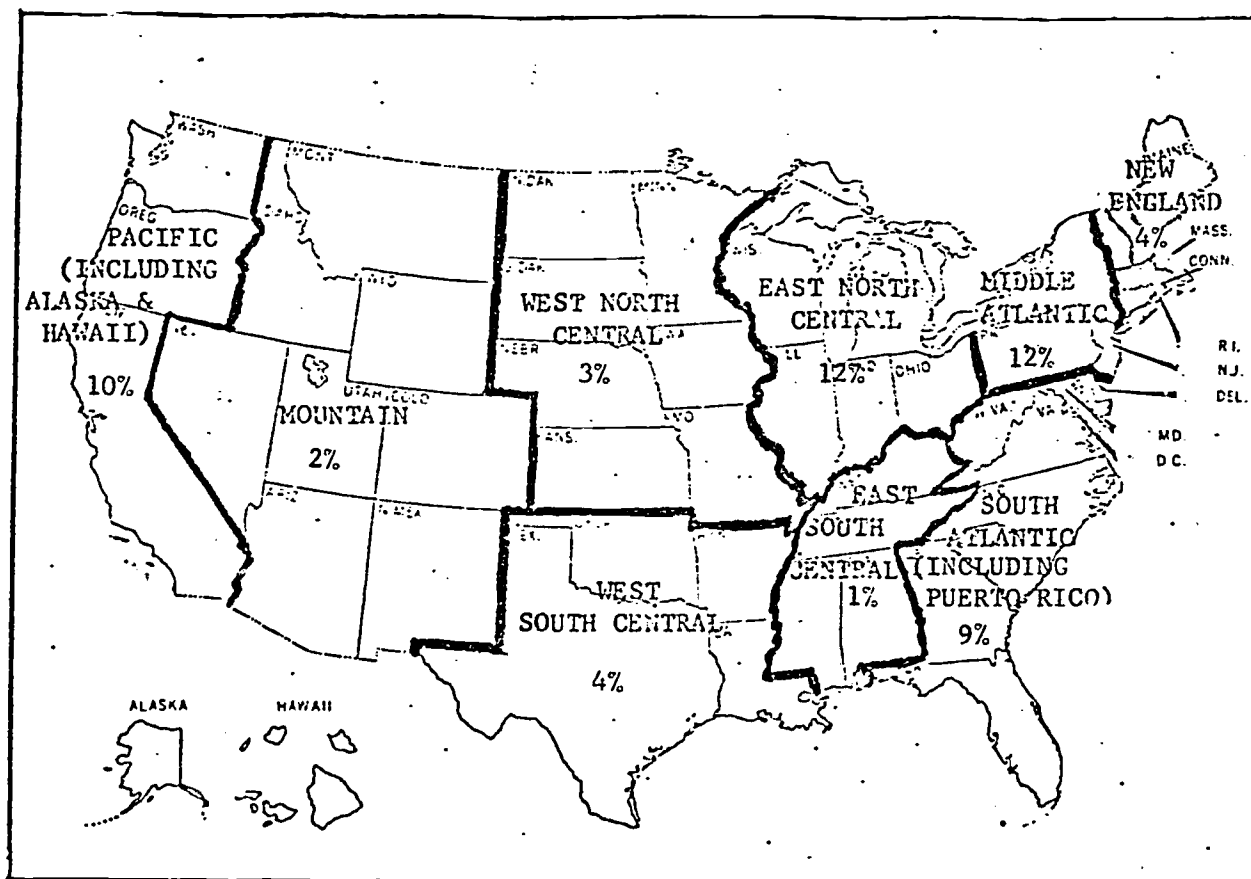

5. Professional Specialization and Activities of the Respondent Community

The preceding section characterized the academic background of the language sciences community as defined by the responses to the National Register questionnaire. The following pages concern the professional identification and activities of the respondents.

By dividing the respondents according to their professional area into broad groups of linguistics, language teaching, and other fields, it was found that the majority (52%) were employed as linguists, 33% as language teachers, and 6% in other fields such as information retrieval, anthropology, and area studies. The attempt to categorize the respondents by their professional identification, however, was more difficult due to the different interpretations of the question involved; that is, some answered in terms of their work activities while others answered in terms of their specialization, to produce such results as "professor" for activity and "historical linguistics" for specialization. Moreover, others regarded the question from the combined points of view, resulting in, for example, "professor of historical linguistics". This difficulty, notwithstanding, it was clear that most of the respondents were teachers and/or linguists. On the basis of these results, combined with those indicating specialty titles most related to their employment and fields of interest and competence, it was possible to determine the professional areas most in need of LINCOS clearinghouse projects.

Map 1. Geographic Distribution of American Linguists Employed in the United States

NOTE: Percentages are based upon the total number of respondents.

Respondents approached the question concerning professional identification from two points of view. Some responded in terms of their work activity (e.g. teacher); others in terms of their field of specialization (e.g. Romance linguistics). It was necessary, therefore, to divide this section of the study into those two categories for statistical analysis. Table 9A tabulates those who responded in terms of work activity, while table 9B tabulates those responding in terms of field of specialization. Those respondents who approached the question from both points of view, combining activity and field of specialization (e.g. teacher of Romance linguistics) were listed in both categories, thus producing a certain degree of overlap between the two tables. 228 of the respondents did not answer this question.

Because this question allowed for an unstructured response regarding professional identification, with the choice of terminology left to the discretion of the respondents, the terms listed in tables 9A and 9B represent categorization of the titles employed by the respondents themselves. The category "linguist" encompasses such titles as language scientist, descriptive linguist, grammarian, and behavioral speech scientist. The categories chosen were considered to be most significant for purposes of statistical interpretation.

Table 10. Number of Respondents by Professional Specialization

<u>Field of Specialization</u>	<u>Number of Respondents</u>	<u>Percentage</u>
Linguistics	1088	52%
General	935	45%
Applied	153	7%
Language teaching	680	33%
Other fields	136	6%
No response	184	9%
<hr/>		
Total	2088	100%

NOTE: The components of each group are as follows:

General linguistics: descriptive linguistics, including dialectology, field methods, lexicography, and the structure of specific languages or language groups; historical and comparative linguistics, including comparison within a language group, history of a specific language or language group, etymology, and philology; phonetics; teaching of linguistics; theory of linguistics.

Applied linguistics: language aptitude and proficiency testing, language text preparation, teacher training, contrastive structural comparisons, teaching English as a foreign language; literacy and writing systems; mechanized applications of linguistics; linguistics in translation; anthropological linguistics; linguistics and literature; psycholinguistics; sociology of language; speech pathology.

Language teaching: methodology of second language teaching; education; speech.

Other fields: information retrieval and computer science; philosophy; mathematics; psychology; anthropology; area studies; law; physics; chemistry.

	<u>Work Activity</u>							
	<u>Test De- velopment</u>	<u>Teaching</u>	<u>Research & Report Writing</u>	<u>Manage- ment</u>	<u>Con- sulting</u>	<u>Other^a</u>	<u>No Re- sponse</u>	<u>Total</u>
Primary	2 (.1%)	1212 (58%)	398 (19%)	238 (11%)	24 (1%)	45 (2%)	169 (8%)	2088
Secondary	19 (.19%)	310 (15%)	889 (43%)	230 (11%)	103 (5%)	94 (4%)	443 (21%)	2088

NOTE: The questionnaire provided space for two responses concerning employment activities, the first being what the respondent considered his most important employment activity on the basis of time devoted to it, and the second being that work activity rated second most important, also on the basis of time devoted to it. The pair of responses most often listed combined teaching as the primary work activity and research/report writing as the secondary. Nearly three-fifths of the entire population were engaged primarily in teaching, with only one-fifth devoting most of their time to research and report writing. It is interesting to note that the work activity rated most important for scientists overall in the 1966 Report of the National Register of Scientific and Technical Personnel was research and development.

^aUsually self-employed.

Table 15. Number of Respondents by Professional Specialization and by Primary and Secondary Work Activity

Work Activity	Applied Linguistics		General Linguistics		Language Teaching		Other Fields		All Fields

NOTE: Of the societies which the respondents indicated, these four were selected as representative of all respondents for purposes of illustrating the relation between society membership and work activity. Work activities were rated by the respondents on the basis of the amount of time devoted to each activity: "1st"

Table 20 cont.

indicates the work activity which the respondent considered the most important and the most time-consuming and "2nd" the second most time-consuming. In each society the greatest number of members rated teaching as the most important work activity and research/report writing as the second most important.

NOTE: Number of responses = 1,907
 No response = 181
 Total = 2,088

Respondents were asked to check the single category most representative of their present principal employers. "School system" signifies secondary or elementary schools and "nonprofit organization" means those other than educational institutions. The majority of respondents were employed by colleges and universities.

Table 24. Number of Respondents by Type of Employer and by Work Activity

^aThis was a multiple-response question; each percentage figure is based on the total of 2,088.

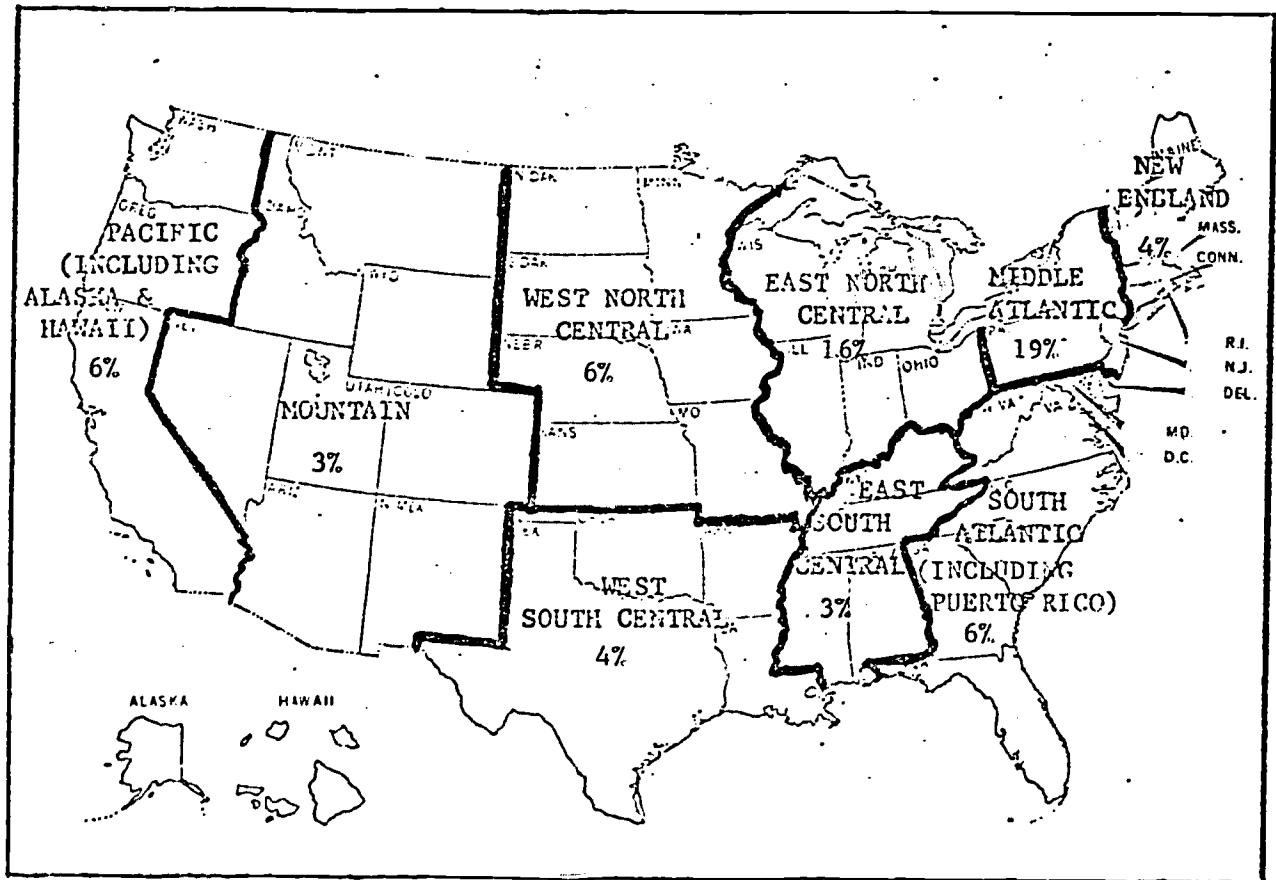

6. Biographical Background of the Respondent Community

Approximately three-fourths of the individuals in this study were born in the United States (see map 2). Almost one-half of the American-born respondents were born in the Middle Atlantic and East North Central regions. Of the respondents born in countries other than the United States (24%), Europe, as anticipated accounted for the largest number: 303, or 61% of the foreign-born. Africa (with 12) and Oceania (with 5) together represented only 3% of the respondents born abroad.

The majority of the respondents, slightly over three-fourths, were men of whom the largest number (274) were between 34 and 39 years of age, whereas the largest number of women (94) were between 29 and 33 years of age. The median age for the entire group, however, was 40 years.

7. Mobility of the Respondent Community

The mobility of the American linguistic community is reflected in the information provided by those respondents born and currently employed in the United States, including Puerto Rico. The population flow can be determined by comparing the number of respondents born in each state with the number remaining in each state for their advanced education and/or for employment, with the number earning their highest degrees from each state, and with the total number employed in each state. It is interesting that Hawaii, with relatively few respondents earning their highest degree in that state, indicated a relatively large number for employment. California, Connecticut, the District of Columbia, and Louisiana indicated a large number of respondents receiving their highest degree in each state as well as considerable movement into the area of employment. Maryland, Nevada, Rhode Island, and South Carolina represented mobile populations as to number of respondents born, educated, and employed in each, whereas Kansas showed static birth and employment figures, but a drop in number of degrees granted in the area. Washington and Wisconsin remained static for birth and employment but showed an increase in the number of respondents receiving advanced education.

New York ranked first in number of respondents born there, educated there, and employed there; Texas ranked eighth in each. The District of Columbia ranked ninth as the place where the highest degree was granted but fourth as a place of employment. Michigan, Indiana, and Massachusetts showed the same pattern, with the number receiving their highest degree in each state far greater than that born or employed there. Pennsylvania and Illinois illustrated reverse patterns with the number receiving their highest degree in each far smaller than that born or employed there.

Overall movement into the United States seemed to be greater than movement out.

Map 3. Population Movement by Place of Employment and Place of Birth

LEGEND:

The number of respondents employed in these states (only those with more than 15 respondents were included) is significantly greater than the number born there.

The number of respondents born in these states (only those with more than 15 respondents were included) is significantly greater than the number employed there.

There is no significant difference between the number of respondents employed in these states and the number born there.

SPECIALTIES LIST

FOR USE WITH

1968 NATIONAL REGISTER OF SCIENTIFIC AND TECHNICAL PERSONNEL

In the section PROFESSIONAL EMPLOYMENT on the 1968 National Register Questionnaire you are requested to select from this list the specialty most closely related to your present employment and other specialties in which you may have competence (item 13). Please use the specialty title from this selected list; if you select the "Other" category, use that code number and write in your brief specialty title.

Applications to language teaching

- 16816—Language aptitude and proficiency testing
- 16824—Language laboratories
- 16832—Linguistics in language-textbook construction
- 16840—Linguistics in second-language pedagogy
- 16857—Linguistics in the teaching of native-language skills
- 16865—Linguistics in the training of language teachers
- 16873—Use of contrastive structural comparisons
- 16899—Other (specify)

Descriptive linguistics

- 16915—Contrastive analysis
- 16923—Dialectology
- 16931—Field methods
- 16949—Lexicography
- 16956—Morphology
- 16964—Phonology
- 16972—Structural analysis
- 16980—Structure of specific languages (specify language(s))
- 17012—Study of writing systems
- 17020—Syntax
- 17095—Other (specify)

Language in relation to other fields

- 17319—Anthropological linguistics
- 17327—History of linguistics
- 17335—Interrelationships of language and other cultural phenomena
- 17343—Linguistics and literature
- 17350—Physiology of speech and hearing
- 17368—Psycholinguistics
- 17376—Sociology of language
- 17384—Speech pathology
- 17392—Other (specify)

Language policies

- 17418—Language standardization
- 17426—Problems of linguistic minorities
- 17434—Translation of technical terminology
- 17491—Other (specify)

Literacy and writing systems

- 17517—Devising of writing systems
- 17525—Materials for new literates
- 17533—Teaching of literacy
- 17590—Other (specify)

Mechanized applications

17129—Language contact
 17137—Mathematical models in linguistics
 17145—Statistical studies of language
 17152—Study of meaning
 17160—Theory of grammar
 17178—Typology and language universals
 17194—Other (specify)

Historical and comparative linguistics
 17210—Comparison within a particular group of languages (specify group[s])
 17228—Etymology
 17236—History of specific languages (specify language[s])
 17244—Reconstruction, subgrouping, and processes of language change
 17293—Other (specify)

17699—Other (specify)

Phonetics
 17715—Acoustic phonetics
 17723—Articulatory and instrumental phonetics
 17798—Other (specify)

Other specialties
 17814—Information retrieval
 17822—Methodology of second language teaching
 17830—Teaching of linguistics
 17848—Education
 17855—Philosophy
 17863—Speech
 17871—Translation
 17897—Linguistics, other (specify)

OTHER FIELDS OF SCIENCE

00200—Astronomy
 00802—Atmospheric Sciences
 02907—Chemistry
 06809—Earth Sciences
 05702—Physics
 08607—Mathematics
 24000—Computer Science
 09803—Statistics
 12500—Agricultural Sciences
 12609—Biological and Biomedical Sciences
 14704—Psychology
 15206—Anthropology
 16709—Economics
 18903—Political Science
 19802—Sociology
 21105—Other (specify)

PROFESSIONAL EMPLOYMENT CONTINUED

13. From the specialties list (see overleaf), select and enter both the number and scientific specialty most closely related to your PRESENT principal employment; or write in your specialty if it is not on the list.

Also enter other scientific specialties in which you have competence.

one:	Number	Specialty Title	three:	Number	Specialty Title
two:	Number	Specialty Title	four:	Number	Specialty Title

NOTE: Salary and income information is regarded as confidential and will be used for statistical purposes only. It will NOT be released in any way that will allow it to be identified with you.

14. 1968 BASIC ANNUAL SALARY: Please give the basic annual salary associated with your principal professional employment to the nearest hundred dollars.

If academically employed, check whether salary is for ☐ 9-10 mos. or ☐ 11-12 mos.

(Basic Annual Salary is your annual salary before deductions for income tax, social security, retirement, etc., but does not include bonuses, overtime, summer teaching, or other payment for professional work. Do not include rental or subsistence allowances.)

15. ESTIMATED GROSS ANNUAL PROFESSIONAL INCOME (Jan. 1 to Dec. 31, 1968): Please give your estimated gross income from all professional activities for the year.

(Gross Annual Professional Income is ALL payment received for professional activities including basic salary before deductions, plus bonuses, royalties, fees, honoraria, etc.)

16. How many years of professional work experience, including teaching, have you had?

LANGUAGE AND AREA KNOWLEDGES:

17a. FOREIGN LANGUAGE: List those languages in which you have substantial competence and select the appropriate codes. Extinct languages may be mentioned if appropriate.

- If you have no foreign language competence, check here. ☐
- PROFICIENCY CODE**
- | | |
|--|---|
| 1 Native or near-native command of the spoken language. | 6 Within your special field, ability to translate into the language or to lecture or write in it. |
| 2 Fluent though obviously non-native in speaking. | 7 Translate or interpret for most purposes. |
| 3 Adequate for general conversation. | 8 Have carried out extensive technical linguistic analyses. |
| 4 Read difficult material easily. | 9 Have taught the language. |
| 5 Reading knowledge adequate for research in your field. | |
